

# Diagnosis Detective: Curing Granulomatous Mastitis

## What is Granulomatous Mastitis?

Granulomatous mastitis is a rare inflammation of the breast that is characterized by the formation of granulomas, which are small collections of inflammatory cells. The exact cause of granulomatous mastitis is unknown, but it is thought to be related to an autoimmune disorder.

Granulomatous mastitis can affect women of any age, but it is most commonly seen in women between the ages of 30 and 50. Symptoms of granulomatous mastitis include:

- A lump or thickening in the breast
- Breast pain

- Nipple discharge
- Swelling or redness of the breast
- Fever
- Fatigue

## **Diagnosing Granulomatous Mastitis**

Diagnosing granulomatous mastitis can be challenging, as it can mimic other breast conditions, such as breast cancer. To diagnose granulomatous mastitis, your doctor will likely perform a physical examination of your breasts and Free Download one or more of the following tests:

- Mammogram
- Ultrasound
- Biopsy

## **Treating Granulomatous Mastitis**

The treatment for granulomatous mastitis typically involves a combination of antibiotics and corticosteroids. Antibiotics are used to treat the infection, while corticosteroids are used to reduce inflammation. In some cases, surgery may be necessary to remove the granulomas.

## **Outlook for Granulomatous Mastitis**

The outlook for granulomatous mastitis is generally good. With proper treatment, most women are able to make a full recovery. However, granulomatous mastitis can recur in some cases.

## **Diagnosis Detective: Curing Granulomatous Mastitis**

If you are experiencing any of the symptoms of granulomatous mastitis, it is important to see your doctor right away. Early diagnosis and treatment can help to improve your chances of a full recovery.
